

CoffeeScript

What the world needs
is *less* syntax, not more

<http://jashkenas.github.com/coffee-script/>

```
#require underscore.js
```

JavaScript:

```
_([]).map(function(obj) { obj })
```

CoffeeScript:

```
_([]).map obj -> obj
```

```
() -> alert("lambda") => function() { alert  
("lambda"); }  
(() -> alert("lambda"))()
```

```
-> alert "lambda"  
(-> alert "lambda")()
```

```
"String".toLowerCase()  
do "String".toLowerCase
```

Ruby:

```
hello ||= "world"
```

```
hello << "!" if hello
```

CoffeeScript:

```
hello ?= "world"
```

```
hello += "!" if hello
```

```
if hello then hello += "!"
```

```
message = ""Hello Martynas,
```

```
How cool is this?
```

```
Cheers,  
Edvinas""
```

(name, addresses..., something) ->
console.log addresses

```
array = [1..100]  
a1 = array[..10]  
a2 = array[...10]  
a3 = array[1..10]
```

```
for x in [1..100] by 10  
  console.log x
```

```
for x in [1..100] by 10  
  console.log x
```

```
for key, value of {}  
  console.log value
```

```
for k, v of {} when k in ['foo']  
  console.log value
```

0 == '0'

0 == ''

$x = 0$

$f = (g=(do \rightarrow x++), h=(do \rightarrow x++)) \rightarrow [g, h]$

$f()$

$(a = 1, b = 1) \rightarrow a * b$
